September 2015
An Analysis of the Potential Need for Primary Care Practitioners and Specialty Physicians in the Medical Service Area of Okeene Municipal Hospital

Introduction

This report will examine the need for primary care practitioners and specialty physicians in the medical service areas of Okeene Municipal Hospital in Okeene, Oklahoma. Primary care practitioners include family practice or general medicine physicians, internal medicine physicians, OB/GYN, pediatricians and mid-level primary care practitioners. Specialty physicians included are allergists, cardiologists, gastroenterologists, oncologists, nephrologists, neurologists, pulmonologists, rheumatologists, surgeons performing general surgeries and surgeons performing specialty surgeries in the areas of ENT, ophthalmology, orthopedics and urology. Specifically, the study will:

1. Illustrate the populations of the primary and secondary medical service areas (MSAs) of Okeene Municipal Hospital;
2. Estimate total office visits and primary care physician office visits in the MSAs of Okeene Municipal Hospital;
3. Estimate the total need for primary care practitioners in the MSAs of Okeene Municipal Hospital based on local usage rates; and
4. Estimate the need for selected specialty physicians in the MSAs.

No recommendations will be made. The information included in this report is designed to assist local decision-makers in assessing the need for primary care practitioner services and specialty physician services.
Medical Service Area of Okeene Municipal Hospital

The MSA of Okeene Municipal Hospital includes a primary and a secondary MSA. The primary MSA includes three zip code areas: 73724 Canton, 73755 Longdale, and 73763 Okeene. The secondary MSA includes seven zip codes: 73646 Fay, 73663 Seiling, 73718 Ames, 73737 Fairview, 73747 Isabella, 73768 Ringwood, and 73772 Watonga. Figure 1 illustrates the zip code medical service areas (MSAs) utilized in this study. Most hospital MSA’s can be divided into areas, i.e., primary, secondary and/or tertiary based on the utilization by the residents. The difference in utilization is typically impacted by distance from another hospital and/or physician clinic. For this analysis, it was assumed that 95 percent of the primary service area population utilizes the health care services at the hospital. Many of the residents located in the other seven zip codes utilize health care services at alternative hospital MSAs such as Watonga, Seiling, and Fairview. Therefore, the other seven zip codes were designated as the secondary MSA with an estimated 30 percent of the population utilizing health care services of the hospital.

Table 1 presents the 2010 Census population by age and gender for each zip code. The total population for the primary MSA was 3,718 and the secondary MSA was 13,556. Table 2 presents the estimated number of annual physician office visits by age and gender. For instance, for males under age fifteen, the average number of annual physician office visits is 2.8 visits per year. These data were from the National Ambulatory Health Care Survey: 2010 Summary Tables from the U. S. Department of Health and Human Services.

Table 3 presents the number of annual physician office visits generated in the primary and secondary MSAs. These office visits were estimated by multiplying the 2010 Census population by age and gender groups by the corresponding estimated number of annual physician office visits. Of these total office visits, recent data indicate that 55.5 percent of total physician

Local Primary Care Office Visits Per Year \((60,260 \times 0.555 = 33,444)\) \(33,444\)

office visits will be made to practitioners active in primary patient care while the remainder will be made to specialists [3].

Using the office visit data presented in Table 2, the primary MSA will generate 17,516 total annual physician office visits (Table 3). The local primary care physician office visits were based on 55.5 percent of total office visits to primary care practitioners for a total of 9,721 primary care office visits (17,516 x 0.555 = 9,721). The secondary MSA will generate 33,444 primary care office visits (60,260 x 0.555 = 33,444.)

The total number of primary care office visits given various utilization rates from the primary and secondary MSAs is presented in Table 4. The usage levels will not be the same for both areas and will depend on location of physicians, geographic or transportation barriers and personal preferences. If 95 percent of the residents in the primary MSA and 30 percent of the residents in the secondary MSA utilize physicians in the Okeene Municipal Hospital MSA, the estimated annual primary care office visits would total 19,269.

The national average for the number of annual office visits to each primary care physician is 5,000 [3]. Utilizing this average, the MSA could support an estimated 3.9 primary care physicians. Okeene Municipal Hospital and its local practitioners draw patients from zip codes that are clearly in close proximity to other providers. It can be difficult to measure the demand generated by the secondary MSA. If necessary, local officials can use the information presented in Table 4 to more accurately represent the utilization of the secondary MSA population.

As presented in Table 5, Okeene Municipal Hospital currently has three full-time equivalent family practice physicians and one family practice physician assistant. For this study, it was assumed that NPs and PAs provide care to approximately 50 percent of the number of

</table>

If 95% primary medical service area and 30% secondary medical service area, then the usage would be:
19,269 total primary care office visits
for an estimated 3.9 Total Primary Care Physicians
Based on 5,000 average annual primary care office visits per physician practice

office visits as a primary care physician. This results in 3.5 FTE primary care physicians. Based on the results of this study showing the need for 3.9 primary care physicians, there may be a need for another 0.5 family practice physician or one midlevel provider in the Okeene Municipal Hospital MSA. Higher usage levels would indicate that additional practitioners could be supported. Users of the data will have to choose the most appropriate utilization rates and
estimate primary care practitioner needs based on local knowledge. All assumptions and local conditions including actual utilization levels and patient volume managed by NPs and PAs must be considered. Again, primary care practitioners include family practice and general medicine physicians, internal medicine physicians, OB/GYN, pediatricians, NPs and PAs. All types of practitioners should be considered when analyzing the primary care practitioner needs in the MSAs.

Estimating Need for Specialty Physicians

To estimate the need for specialty physicians, a different methodology was utilized. From the literature, averages of baseline populations were determined that represented the level of population necessary to support a specialty physician in each respective specialty [4,5]. Based on these average population-to-specialty physician ratios, an estimate of need was determined for eight medical specialties and five surgical specialties.

Table 6 presents the ratio between the baseline population and the support of FTEs of specialty physicians given each particular specialty, along with the equivalency of FTEs to workdays per week. For example, a population of 12,389 would be required to fully employ one general surgeon. Based on the assumption that the utilization rates would be the same for

specialist as primary care practitioners, the surgical needs in the Okeene Municipal Hospital MSAs would support approximately 0.6 general surgeons which is equivalent to 3.1 workdays per week. Table 6 also presents these estimates for the other specialty physicians. There are minimal specialty physicians currently providing services in the Okeene Municipal Memorial Hospital service area. Table 7 shows a urologist and a cardiologist providing quarterly visits. The hospital has also just started a tele-hospitalist program the end of July and no estimates of actual usage are available yet.

Total FTEs: 0.08

SOURCE: Okeene Municipal Hospital (August 2015).
* New program just started end of July 2015.

Typically, since smaller, rural populations are only able to support a fraction of a FTE for many of the specialty care physicians, hospitals or other entities host specialty clinics that have a rotation of specialty care physicians practicing there. The supporting hospital usually provides the facility and maybe an office person to help with scheduling and the physician brings clinical staff and completes the billing. In this way, the specialty care physician needs of the community can be met without a specialty care physician actually residing in the community.
Unique economic impacts are gained through a community utilizing specialty physician clinics. However, the impacts on the local community are difficult to quantify. Different diagnoses and specialists will bring differing revenues. Notably, research has shown that by providing specialty clinics in communities, fewer dollars are out-migrated to other communities for laboratory and pharmacy services. A 2006 survey in Louisiana found that over 90 percent of the patients who went out-of-town to visit a specialist also received their laboratory work and pharmacy services at the specialists’ locations [7].
Summary

The analysis above presents the methodology and results for estimating the need for primary care practitioners and specialty physicians in the MSAs of Okeene Municipal Hospital, located in Okeene, Oklahoma. The results for primary care practitioners suggest that, given a 95 percent utilization rate from the primary MSA and a 30 percent utilization rate from the secondary service area, an estimated 3.9 FTE primary care physicians can be supported. Currently, there are 3.5 physician equivalents providing family practice services. The actual number of physicians that the MSA of Okeene Municipal Hospital can support will vary based on the locally-determined utilization rates. Estimates of these utilization rates should be used in conjunction with the current status of the primary care physicians, NPs and PAs in the MSA.

In addition to estimating the need for primary care practitioners, a methodology was introduced that can assist communities in determining the need for selected specialty physicians. Based on the population of the MSA, an FTE of 0.6 general surgeons could be supported by patients of Okeene Municipal Hospital. The need for general surgeon services is equivalent to 3.1 days per week. The other selected specialties are also illustrated.

Many assumptions have been made in this analysis. These include items that may change, such as the area included in the MSA, the total population in the MSA or usage rates of the primary and secondary MSAs. These assumptions will change with the exit or entry of physicians or NPs and PAs from nearby communities. Should this occur, revised estimates of office visits should be calculated.

All assumptions should be closely examined by local decision-makers to verify that they reflect local conditions. If additional local data are available, these data should be utilized to derive the most realistic conclusion possible for the local community.
